

IN THE ABSTRACT:

Please replace the abstract with the following:

a7 A device [(1) with] comprising playback means [(6)] for reproducing a recorded signal (AS) recorded on a recording medium [(5)] starting from a recording medium start position (P1) of the recording medium [(5)] and starting from a recording start time (T1) by means of at least one playback head [(7, 8), and with] positioning means [(27)] for positioning said at least one playback head [(7, 8) into] with respect to a desired recording medium position [(GP1, GP2)] for the reproduction of a recorded signal (AS) starting from said recording medium position [(GP1, GP2), also comprises] and input means [(30)] for entering a playback time information (WZI) which characterizes a desired playback moment [(GT1, GT2), said desired playback moment (GT1, GT2)] corresponding to the sum of a starting time information (BZI) characterizing the recording start moment (T1) and a recording time period (VD1, VD2) which has already elapsed in the recording of the recording signal (AS) in the desired recording medium position [(GT1, GT2) of the recording medium (5), [while the] wherein said desired recording medium position is determined by said positioning means [(27) are designed for] by subtracting the starting time information (BZI) from the playback time information (WZI), [put in for determining the desired recording medium position (GP1, GP2).
